

What is LandServer?

A free, online, conservation assessment tool for private landowners, agricultural producers, and property managers.

By opening a private LandServer online account, you can generate a conservation report about the valuable ecosystem services and other natural resource benefits provided by your land. Based on this information, LandServer will evaluate your potential to earn payments and other conservation funding for implementing land practices that enhance ecosystem services.

What are the benefits?

- ▶ Quickly and easily learn about your property's natural resources and the ecosystem services that it provides.
- ▶ Evaluate your potential to enroll in valuable state and federal cost share programs.
- ▶ Evaluate your property's potential to receive payments for implementing land practices that enhance ecosystem services.
- ▶ Save time and money by using the Bay Bank to sell "ecosystem service credits" generated on your property and enroll in conservation programs.

What are Ecosystem Services?

Clean air to breath, clean drinking water, biological diversity, food and fiber. The natural resources on your property form the foundation of your region's natural life support system by providing ecosystem services—the natural processes that contribute to the health of your region's environment and quality of life. Working, conservation, suburban, and other rural lands can implement land practices that enhance and sustain these services and generate ecosystem service credits. Interested buyers can access these ecosystem service credits through conservation marketplaces such as the Bay Bank at www.thebaybank.org.

How do I get started?

LandServer has been designed and developed through a unique collaboration of partners. Learn more about LandServer and create an account at www.landserver.org.
